

# Ushapeworkstations

**A U-Shape workstation is commonly created by connecting two L-Shape workstations together with an In-Line workstation.** U-Shape layout configurations are frequently used within the interior of a room when there are no windows. These configurations permit the most efficient use of wall space, while leaving the center area of the room free for movement and traffic. It provides the maximum number of sorter openings and offers the greatest amount of storage space available.

Small corner sorters are used to connect the ends of larger sorters to maintain a smooth flow within the mailroom. Enclosed lower storage provide for additional storage space for mailroom supplies. Modular components can be added above and below workstation as required. All sheet metal components are 14-20 gauge steel and adjust to a variety of heights to accommodate any worker. All mailroom tables can support up to 1500 lbs.
